

## More than just spam-filter.

- **Checks sender, recipient, and contents to protect against unwanted advertising and spam e-mail.**
- **Prevents unauthorized transmission of confidential information through lexical analysis of text and file attachments.**
- **Monitors and controls permissible sender-recipient combinations in accordance with company policy.**
- **Works even with encrypted e-mails.**
- Blocks e-mails from undesired senders (e.g. spam senders, mailing lists).
- Address checks support wildcards (e.g. „\*“ in exception lists and address lists).
- Blocks e-mails to undesired recipients (e.g. competitors).
- Also checks encrypted e-mails when used with securiQ.Crypt.
- Protects against the dissemination of offensive e-mail contents.
- Blocks the unauthorized transmission of business-critical information.
- Automatically uses existing address book information to create rules.
- User-definable word lists for content checking.
- Minimizes „False Positives“ when checking contents through weighting and threshold settings.
- Optional detailed notification e-mails to administrator on rule violations.
- Optional notifications to e-mail senders and recipients.
- Central administration through a common user interface.
- Runs on nearly all operating systems supported by the mail platform.
- Detailed logging of e-mail processing.
- Uses dedicated quarantine areas.
- Protects Groupware databases.
- Content restrictions in e-mail subject, body and file attachments.
- Protects against mail flooding attacks.
- Restricted number of recipients per e-mail.
