

- Identify the changes to a previous template
- Determine if changes were made to a production application
- Identify what changed between a known working version and the production database

## Teamstudio® Delta

Automated comparison tool to identify changes between databases

**Teamstudio Delta** allows developers and administrators to compare the differences between two databases for both design elements and documents. With Delta, they can quickly identify design changes between two versions of a database in a visual side-by-side display.

Development without Delta...	Development with Delta...
Do you spend too much time trying to identify the impact of a new Notes® Mail template on your existing customized version?	You can quickly identify all the changes you made to the last template so you can apply them to the new version.
If an application fails and you have been unable to duplicate the problem in development, you have no way, other than searching line-by-line, to determine if a change was made to the production application.	You can immediately check if any changes were made to the production application, and then move on to other solution possibilities.
Have your production documents ever been inadvertently or maliciously modified, leaving you desperate for a way to identify the specific changes?	You can quickly identify what changed between a known working version and the production database, speeding problem resolution.

Delta technology goes beyond providing comparisons of complete applications and databases. In addition to the examples provided above, Delta can also be used to examine two documents to produce a side by side visual comparison of the differences between them.

### Who Is Teamstudio?

Teamstudio designs technologies that address IT governance requirements — with policies and best practices for control, compliance, efficiency, and security within the Lotus Notes environment.

We call our approach "Just Enough Governance for Notes."
